MAM · Missing App Monitor

Monitor and control the computers on your LAN: easy to install, runs for real, no cloud needed.

See every machine at a glance

CPU, RAM, temperature, disk space, current user, hardware and disk health, refreshed about every 5 seconds.

Automatic alerts

Overheating, sustained high CPU, nearly full disk, lost connection: alerts open by themselves and close when the problem is gone.

Remote commands

Lock the screen, send a message, restart, shut down, wake up with Wake-on-LAN, for one machine or a whole group.

Remote screen control

See and control a Windows machine in a window of its own, with the user's consent or the administrator's password. Every access is logged.

Talk to the user

Send a message and the MAM window pops up on the client screen; the person at the machine replies right there and the reply shows in the audit log.

Support requests with follow-up

Users report problems right on the machine; technicians pick them up, reply and record the fix; filter by status, device type and date, with suggestions from earlier fixes.

Uptime and machine errors

When each machine was on and off and for how many hours by day, week, month, year; 180 days of Windows errors (blue screens, disk, app crashes...).

Backup to another drive

Hourly backup to another drive, USB or NAS, checked and alerted; restore even when the server is gone.

Roles and audit log

Three roles: Super admin, Technician (limited to assigned groups), View only. An append-only audit log that cannot be edited or deleted.

Installed in minutes

Double-click one file and you are done: download the pre-configured MAM-Agent.exe from the Console, or use the graphical installers. Update by running the newer version over the old one; data is kept.

Three languages

The Console, server, agents and installers come in Vietnamese, English and Simplified Chinese.

Your data stays on your network

No cloud, no third-party account, no subscription. The source code ships with the package.

Control right in the list

Every machine row has Lock, Message, Restart, Off or Wake buttons; select many machines to command them together.

Movable data

Move the data to another drive from the Console, no reinstall.

Good for

- Small and mid-sized companies and offices
- School computer labs and training centres
- Internet cafés and shops with many POS machines
- Homes with a few machines to look after

Requirements

- Server: Windows 10/11, Server 2016+ or Linux
- Clients: Windows 7 to 11, Server 2008 R2+
- A LAN, TCP port 7070
- A modern browser for the Console

Not available yet. Scheduled report delivery. Screen control is Windows only. Lock screen needs Windows Pro or later.
